Hover tooltip for `current.eGet()`

Returns the value of the given feature of this object. It returns the resolved value, i.e., it returns the value of the given feature of this object.

Parameters: feature the feature of the value to fetch.

Returns: the value of the given feature of this object.

See Also: [eGet\(EStructuralFeature, boolean\)](#)

Annotations: @ignore, @model, @generated

JUnit

org.eclipse.xtext.scoping.impl.AbstractDeclarativeScopeProvider

A scope provider that invokes methods reflectively. At first it looks for methods of the following signature: IScope scope_[EClassName]_[EReferenceName](MyType context, EReference ref)

That is if `getScope(EObject, EReference)` is called where EReference is e.g. Property.type and the ctx is an instance of Property, than the corresponding signature could be:

IScope scope_Property.type(Property prop, EReference ref)

AbstractDe...peProvider

So what's the
Problem?

It's the Language
not the Tooling!

Level of Abstraction

The background of the slide is a blue-tinted photograph of classical architecture. The top half shows a row of tall, fluted columns. The bottom half shows a close-up of a column capital, which is a decorative top part of a column, resting on a base. The overall aesthetic is clean and professional, with a strong emphasis on the blue color scheme.
