

String Formatting Library

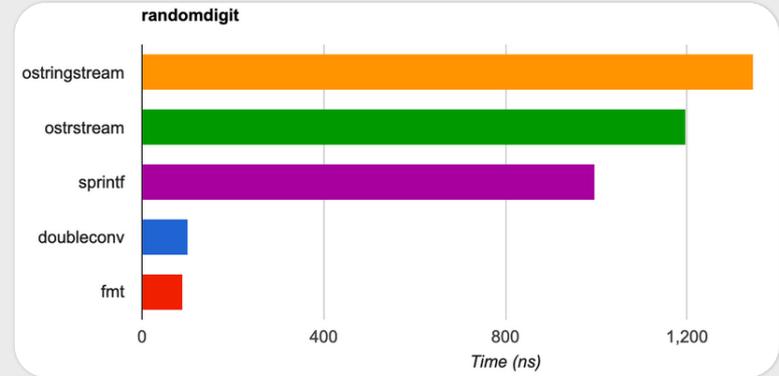

{fmt} is an open-source formatting library for C++.

It can be used as a safe and fast alternative to (s)printf and iostreams.

- Replacement-based format API with positional arguments for localization
- Format string syntax similar to the one of str.format in Python

```
fmt::print("Hello, {}!", "world"); // Python-like  
fmt::printf("Hello, %s!", "world"); // printf format
```

- High performance
- Officially integrated into [C++20 std::format](#)
- License: MIT
